a labeling protocol that associates a label with a destination, said label comprising at least one of a wavelength and a fiber number [to associate a label with a route table destination],

the controller controlling said switch such that said switch uses said wavelengths of said link to route said traffic between said nodes of said network.

## 32. (Amended) A network, comprising:

a plurality of nodes for communicating with one another; and

a plurality of optical switches for routing traffic between said nodes, each of said optical switches comprising:

- 1) a switch coupled to communications links used for input and output in which a plurality of wavelengths are used to carry traffic on a communications link; and
- 2) a controller, coupled to the switch, for controlling an operation of the switch by implementing a routing protocol, and implementing a labeling protocol that associates a label with a destination, said label comprising at least one of a wavelength and a fiber number [to associate a wavelength with a route table destination],

the controller controlling said switch to direct various wavelengths of traffic from an input link to an appropriate output link as determined by the routing protocol and the labeling protocol.

## 33. (Amended) A network, comprising:

a plurality of nodes for communicating with one another; and

a plurality of optical switches for routing traffic between said nodes, each of said optical switches comprising:

- 1) a switch coupled to communications links used for input and output in which a plurality of wavelengths are used to carry traffic on a communications link; and
- 2) a controller, coupled to said switch, for controlling an operation of said switch by implementing a routing protocol and exchanging routing information with other nodes, implementing a network protocol and forwarding said traffic to a next hop, and implementing a labeling protocol that associates a label with a destination, said label

comprising at least one of a wavelength and a fiber number [to associate a label with a route table destination],

the controller controlling said switch such that said switch uses said wavelengths of said link to route said traffic between said nodes of said network.

- 34. (Amended) A method of communicating over a network having a plurality of nodes, comprising:
- 1) coupling a switch to communications links used for input and output in which a plurality of wavelengths are used to carry traffic on a communications link; and
- 2) controlling an operation of the switch by implementing a routing protocol, and implementing a labeling protocol <u>that associates a label with a destination</u>, <u>said label</u> <u>comprising at least one of a wavelength and a fiber number</u> [to associate a wavelength with a route table destination],

said controlling including directing various wavelengths of traffic from an input link to an appropriate output link as determined by the routing protocol and the labeling protocol.

- 35. (Amended) A method of communicating over a network having a plurality of nodes, comprising:
- 1) coupling a switch to communications links used for input and output in which a plurality of wavelengths are used to carry traffic on a communications link; and
- 2) controlling an operation of said switch by implementing a routing protocol and exchanging routing information with other nodes, implementing a network protocol and forwarding said traffic to a next hop, and implementing a labeling protocol that associates a label with a destination, said label comprising at least one of a wavelength and a fiber number [to associate a label with a route table destination]; and

using said wavelengths on said link to route said traffic between said nodes of said network.

36. (Amended) A signal-bearing medium tangibly embodying a program of

09/433,239 YOR.142

machine-readable instructions executable by a digital processing apparatus to perform a method of routing traffic over a network having a plurality of nodes, said method comprising:

causing a switch to be coupled to communications links used for input and output in which a plurality of wavelengths are used to carry traffic on a communications link; and

controlling the operation of <u>a</u> [an] switch by implementing a routing protocol, and implementing a labeling protocol <u>that associates a label with a destination, said label</u> comprising at least one of a wavelength and a fiber number [to associate a wavelength with a route table destination],

said controlling including directing the various wavelengths of traffic from an input link to an appropriate output link as determined by the routing protocol and the labeling protocol.

37. (Amended) A signal-bearing medium tangibly embodying a program of machine-readable instructions executable by a digital processing apparatus to perform a method of routing traffic over a network having a plurality of nodes, said method comprising:

causing a switch to be coupled to communications links used for input and output in which a plurality of wavelengths are used to carry traffic on a communications link; and

controlling an operation of said switch by implementing a routing protocol and exchanging routing information with other nodes, implementing an network protocol and forwarding said traffic to a next hop, and implementing a labeling protocol that associates a label with a destination, said label comprising at least one of a wavelength and a fiber number [to associate a label with a route table destination]; and

using said wavelengths of said link to route said traffic between said nodes of said network.
